

Fabric Flo — Windows Quick Start (Cursor + all commands)

Print this PDF or keep it open while you set up Windows 11. Michael Keating · June 2026 · Plain English

Repo: <https://github.com/KeatingMichael/fabric-flo>

Live site: <https://fabricflo-app.com>

You do NOT need a USB drive — clone from GitHub.

What PDFs already exist in docs/

Open this file	When
Fabric_Flo_Windows_Quick_Start.pdf	Start here — this doc, all commands
Fabric_Flo_Transfer_To_Windows.pdf	Extra detail on clone + Android later
Fabric_Flo_Complete_Roadmap.pdf	Full Mac → Windows → both app stores path
Fabric_Flo_Codemagic_Setup.pdf	After Part 1 — TestFlight / iOS builds
Fabric_Flo_Finish_And_Submit_Checklist.pdf	Store submission tick-list
WINDOWS_HANDOFF.md	Paste block for a new Cursor chat (markdown)

After you clone the repo, all of these live in the **docs** folder inside the project.

Step 1 — Install tools (once)

Download and install (defaults are fine):

Tool	Link
------	------

Git for Windows	https://git-scm.com/download/win
Node.js 20 LTS	https://nodejs.org/en/download
Cursor	https://cursor.com (you already have this)
GitHub Desktop (optional, easier clone)	https://desktop.github.com

Close and reopen Cursor after installing Git and Node.

Verify in Cursor terminal (Terminal → New Terminal):

```
git --version
node -v
```

`node -v` should print **v20.x** .

Step 2 — Clone the project in Cursor

You do **not** open the project from GitHub in Chrome. You **clone** it to your PC, then open that folder in Cursor.

Option A — Cursor (recommended)

1. Open **Cursor**
2. Click **Clone repo** on the welcome screen
(or **File** → **Clone Repository**)
3. Sign in to **GitHub** if asked
4. Search **fabric-flo** or paste:

```
https://github.com/KeatingMichael/fabric-flo.git
```

5. Choose folder: e.g. `C:\Users\YourName\Documents\fabric-flo`
6. Click **Clone** → **Open**

Option B — GitHub in Chrome + terminal

1. Go to <https://github.com/KeatingMichael/fabric-flo>
2. Green **Code** → copy HTTPS URL

3. In Cursor terminal:

```
cd $HOME\Documents  
git clone https://github.com/KeatingMichael/fabric-flo.git  
cd fabric-flo
```

4. **File** → **Open Folder** → select `Documents\fabric-flo`

Option C — GitHub Desktop

1. **File** → **Clone repository** → pick **fabric-flo**
2. In Cursor: **File** → **Open Folder** → that folder

Step 3 — Install dependencies

In Cursor terminal (project folder open):

```
npm install
```

Wait until it finishes (first time can take several minutes).

Step 4 — Create `.env` (secrets from Apple Notes)

```
Copy-Item .env.example .env
```

Open `.env` in Cursor. Paste from your password manager / Notes:

```
VITE_SUPABASE_URL=https://zfrekjlqpkipuoliptpd.supabase.co  
VITE_SUPABASE_ANON_KEY=PASTE_YOUR_FULL_eyJ_KEY_HERE  
VITE_FABRIC_FLO_BACKEND=normalized  
VITE_PUBLIC_APP_URL=https://fabricflo-app.com
```

```
VITE_SUPPORT_EMAIL=support@fabricflo.app  
VITE_PRIVACY_EMAIL=privacy@fabricflo.app
```

Use the **Legacy anon public** key (`eyJ...`), not `sb_publishable_` .
Never commit `.env` — it stays on your PC only.

Step 5 — Run the app

```
npm run dev
```

Open Chrome:

URL	What you should see
http://localhost:5173/	Marketing / landing page
http://localhost:5173/app	Sign in → Virgin River production

Stop the server when done: **Ctrl+C** in the terminal.

Step 6 — Paste into a new Cursor chat

Open `docs/WINDOWS_HANDOFF.md` , copy everything **below the first ---- line**, paste into a **new Cursor chat**, and send. That tells the AI where you left off on the Mac.

Sanity checklist

- ☐ `git --version` and `node -v` (v20.x) work
- ☐ Project cloned — you see `src` , `docs` , `package.json`
- ☐ `npm install` finished without errors
- ☐ `.env` filled from Notes (not empty URL/key)
- ☐ `npm run dev` — `/` and `/app` load, sign-in works
- ☐ Opened `docs/WINDOWS_HANDOFF.md` in new Cursor chat

Part 1 complete when all boxes are checked.

What comes next (don't skip order)

1. **Part 2** — Verify live backend + Netlify (likely already done on Mac)
2. **Part 3** — Apple Developer (\$99/yr) + Google Play (\$25) — start early
3. **Part 6** — **Codemagic** → **TestFlight** — priority for label scanning on iPhone
4. **Part 5** — Android Studio → Google Play internal testing

Full path: **Fabric_Flo_Complete_Roadmap.pdf**

Common problems

Problem	Fix
<code>git</code> not recognized	Install Git for Windows, restart Cursor
<code>node</code> not recognized	Install Node 20 LTS, restart Cursor
Clone asks for password	Use GitHub sign-in in Cursor, not your GitHub password
Sign-in fails locally	Check <code>.env</code> URL and anon key — no extra spaces
Slow label scan in browser	Normal in Safari/Chrome — test scans in TestFlight app later

All commands in one block (copy/paste)

```
git --version
node -v
cd $HOME\Documents
git clone https://github.com/KeatingMichael/fabric-flo.git
cd fabric-flo
npm install
Copy-Item .env.example .env
notepad .env
npm run dev
```

Edit `.env` in Notepad (or Cursor) before `npm run dev`.

If you cloned via Cursor's **Clone repo**, skip the `git clone` lines and run `npm install` from inside the project folder.

Fabric Flo — Film fabric & bag tracker for productions.
